Current level of influenza activity: Low seasonal activity
Trend: Stable
Confirmed cases since 2019 week 40: 198 (98% influenza A and 2% influenza B. Of the influenza A cases, 9% were A(H1N1)pdm09, 74% were A(H3N2) and 14% were A(not typed).

Key points – Wales

Surveillance indicators suggest that influenza is circulating in Wales.

The sentinel GP consultation rate for influenza-like illness (ILI) decreased during week 49 (ending 08/12/2019). During week 49, 108 cases of influenza were confirmed but Respiratory Syncytial Virus (RSV) and rhinovirus remained more commonly detected causes of Acute Respiratory Infection (ARI). Other causes of ARI continue to be detected. Confirmed cases of RSV in children under five years of age remained above seasonal baseline threshold this week.

- The Sentinel GP consultation rate for influenza-like illness (ILI) in Wales during week 49 was 7.4 consultations per 100,000 practice population (Table 1).
- The ILI consultation rate decreased compared to week 48 (10.6 per 100,000 practice population) and is now below the baseline threshold (Figure 1).
- The total number of consultations with Out of Hours (OOH) doctors in Wales reported to Public Health Wales during week 49 was 12,003. The proportion of respiratory-related consultations with OOH doctors increased to 22.3% (Figure 7). The percentage of calls to NHS Direct Wales which were ‘influenza-related’ (cold/flu, cough, fever, headache and sore throat) during week 49 decreased to 20.1% (Figure 8).
- Fifteen surveillance samples from patients with ILI, collected by sentinel GPs during week 49, had been received by Public Health Wales Microbiology as at 11/12/2019, four samples tested positive for influenza A(H3N2) (two patients aged 24-34 years, one patient aged 35-44 years and one patient aged 70 years and older), two samples for rhinovirus, one sample for RSV, one sample for enterovirus, one sample for human metapneumovirus, and six samples were negative for all routinely tested respiratory pathogens (Figure 3).
- During week 49, 406 specimens were tested by Public Health Wales Microbiology from hospitalised and non-sentinel GP patients with ARI. The following numbers of patients tested positive: Five influenza A(H1N1)pdm09, 82 influenza A(H3N2), 17 influenza A(not subtyped), one influenza B, 87 RSV, 56 rhinovirus, 13 parainfluenza, 14 enterovirus, 18 human metapneumovirus, 10 adenovirus and four mycoplasma (Figure 4). The proportion of samples from hospital patients positive for influenza was 25.9%, which is above the MEM threshold. 46 respiratory specimens were from patients in intensive care units (ICU), four specimens were positive for influenza A (Figure 5).
- The RSV season continues at medium intensity levels. Fifty-eight (57%) of 86 samples from children younger than five years with ARI tested positive for RSV during week 49 and there were 28.7 confirmed cases per 100,000 in this age-group (Figure 6). The average duration of seasonal activity is 11-13 weeks and week 49 was the seventh week of the current season.
- During week 49, there were four ARI outbreaks reported to the Public Health Wales Health Protection team, two outbreaks were in a school/nursery setting, one in a residential home and one in a community setting. Influenza was confirmed in none of these outbreaks.
- At the end of week 49, uptake of influenza vaccine was: 65.0% in those aged 65 years and older, 35.9% in patients aged six months to 64 years at clinical risk, and 33.1% in children aged two and three years old. In the 798 primary schools visited thus far as part of the universal childhood influenza programme, uptake was 69.3%. 

**Influenza activity in Wales**

*A technical issue is currently affecting data submitted from sentinel practices utilising a specific brand of GP software. As a result, since week 47, data from affected practices has been excluded from calculations of the weekly ILI consultation rate. Weekly rates from week 47 onwards are based on data from approximately 20 practices.*

*The Moving Epidemic Method (MEM) threshold calculated for Wales ILI consultation rates is 11.1 per 100,000. MEM thresholds used in this chart are based on influenza from 2010-11 to 2018-19 seasons.*

Figure 6. RSV incidence rate per 100,000 population aged under five years, week 30 2016 to week 49 2019.
Fig. 8. Influenza related calls to NHS Direct Wales¹ (as a percentage of total calls) from week 49 2015 - week 49 2019 (as of 08/12/2019).

¹ Data supplied by Health Statistics and Analysis Unit, Welsh Government.

Flu related calls are the sum of calls recorded as ‘cold/flu’, ‘cough’, ‘headache’, ‘fever’ and ‘sore throat’. Following changes to the NHS Direct calls system, including the start of the 111 pilot, there has been a change in the way in which denominator data are calculated for this chart, NHS Direct Wales now count the total number of nurse triaged calls (i.e., calls which could have symptom data recorded against them), note that 111 includes out-of-hours calls.

Influenza Vaccine Uptake in Wales

Key points – Influenza activity in the UK and Europe

- As of week 48, influenza activity has continued to increase for several indicators in the UK. Influenza GP consultations increased in Northern Ireland to 28.2 per 100,000 and has now reached the moderate threshold, consultations also increased Scotland to 12.2 per 100,000 but remain below baseline activity. The weekly ILI GP consultation rate in England reported through the RCGP system increased to 10.6 per 100,000, but remains below the MEM threshold for baseline activity (12.7 per 100,000). The syndromic surveillance indicator for influenza reported through the GP In Hours Syndromic Surveillance system was 8.5 per 100,000 in week 48.

- During week 48, 58 samples tested positive for influenza (one influenza A(H1N1)pdm09, 45 influenza A(H3) and 12 influenza A(unknown subtype)) through UK GP sentinel swabbing schemes. Three hundred and seventy-six (17.5%) of the 2,145 respiratory test results reported through Public Health England’s DataMart scheme tested positive for influenza (15 influenza A(H1N1)pdm09, 277 influenza A(H3), 77 influenza A(not subtyped) and seven influenza B). UK summary data are available from the Public Health England National Influenza Report.

- The WHO and the European Centre for Disease Prevention and Control (ECDC) reported that as of week 48, influenza activity continued to increase in parts of the WHO European Region. During week 48, a total of 1,016 sentinel specimens were tested for influenza, 140 of which were positive (35 influenza A(H1N1)pdm09, 55 influenza A(H3N2), nine influenza A(not typed) and 41 influenza B).

World update

- The WHO reported on 09/12/2019 that in the temperate zones of the northern hemisphere, influenza activity started to increase in most countries. Activity was low overall in the Caribbean and Central American countries, except for Jamaica and Honduras. In tropical South American countries, influenza activity remained low. In tropical Africa, influenza activity remained elevated in some countries of Western Africa. In Southern Asia influenza activity was low across reporting countries, but continued to increase in Iran. In South East Asia, influenza activity continued to be reported in Lao PDR and Viet Nam. In the temperate zone of the southern hemisphere, influenza activity returned to inter-seasonal levels. Worldwide, seasonal influenza A(H3N2) viruses accounted for the majority of detections.

- Based on FluNet reporting (as of 06/12/2019), during the time period from 11/11/2019 – 24/11/2019, National Influenza Centres and other national influenza laboratories from 119 countries, areas or territories reported influenza surveillance data. The WHO Global Influenza Surveillance and Response System laboratories tested more than 92,883 specimens during that time period, 7,914 were positive for influenza viruses, of which 5,629 were typed as influenza A (2,682 influenza A(H1N1)pdm09, 1,069 influenza A(H3N2) and 1,878 influenza A(not subtyped)) and 2,285 influenza B (of the characterised influenza B viruses 34 belonged to the B-Yamagata lineage and 1,014 to the B-Victoria lineage).

Update on influenza activity in North America

- The USA Centers for Disease Control and Prevention (CDC) report that during week 48 (ending 30/11/19) influenza activity is elevated and continues to increase in the United States. Nationally, 2,713 (10.2%) out of 26,576 specimens have tested positive for influenza in week 48, of these positives 784 (28.9%) were influenza A and 1,929 (71.1%) were influenza B. Further characterisation has been carried out on 828 specimens by public health laboratories, and 389 tested positive for influenza, 147 (37.8%) were influenza A (103 influenza A(H1N1)pdm09 (79.2%), 27 influenza A(H3N2) (20.8%), and subtyping was not performed on 17 specimens) and 242 influenza B (62.2%).

- The Public Health Agency of Canada reported that during week 48, the influenza season has already started and activity continues to increase as expected for this time of year. The percentage of visits to healthcare professionals due to ILL was 1.3%, which is below the average for this time of year. The percentage of tests positive for influenza increased and is above the seasonal threshold of 8.0%.

Middle East respiratory syndrome coronavirus (MERS-CoV) – latest update from WHO and ECDC

- On 05/12/19 WHO reported 15 additional cases of Middle East Respiratory Syndrome coronavirus (MERS-CoV), with six associated deaths. Globally, 2,484 laboratory confirmed cases of human infection with MERS-CoV, including 857 associated deaths, have officially been reported to WHO since September 2012.
- The majority of the MERS cases continue to be reported from the Middle East, and specifically from Saudi Arabia. Rapid risk assessments of the situation from ECDC, which contain epidemiological updates and advice for travellers and healthcare workers, are available from: https://ecdc.europa.eu/en/middle-east-respiratory-syndrome-coronavirus

Human infection with avian influenza A(H7N9), China – latest update from WHO

- The latest WHO Influenza at Human-Animal Interface summary (25/06/2019 to 27/09/2019) reports that no new cases of avian influenza A(H7N9) were reported. Since February 2013, a total of 1,568 laboratory-confirmed cases of human infection with avian influenza A(H7N9), including at least 616 deaths, have been reported: http://www.who.int/influenza/human_animal_interface/HAI_Risk_Assessment/en/ http://www.fao.org/ag/againfo/programmes/en/empres/H7N9/Situation_update.html
- The risk of international spread of avian influenza A(H7N9) is considered to be low at present. However, it is important that clinicians are aware of the possibility of human infection with animal influenza, in persons presenting with severe acute respiratory disease, while travelling or soon after returning from an area where avian influenza is a concern. Updates are available from the WHO Global Alert and Response website: http://www.who.int/csr/don/en/
